

Experiment- 7

Aim: Configure OSPF routing protocol

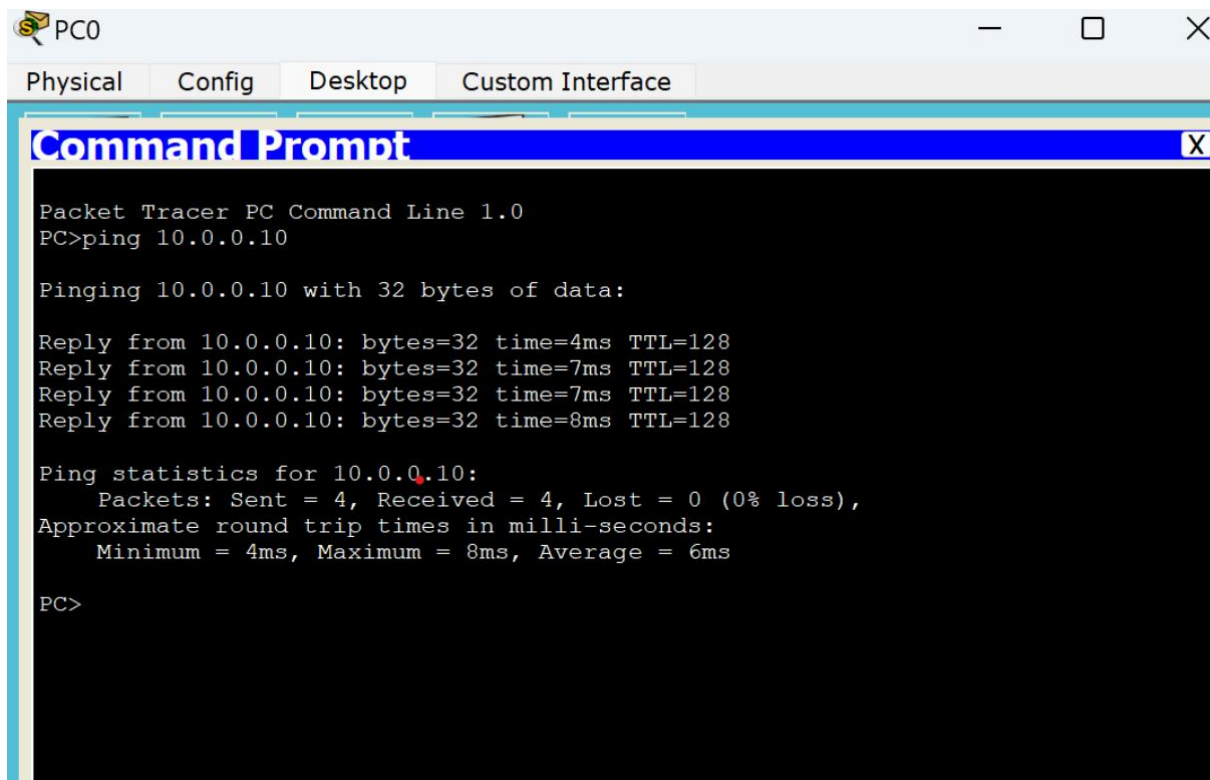

Topology:

```
Router2
Physical Config CLI
IOS Command Line Interface
Loading Done
Router>enable
Router#show ip route
Codes: C - connected, S - static, I - IGRP, R - RIP, M - mobile, B - BGP
       D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2, E - EGP
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
       * - candidate default, U - per-user static route, o - ODR
       P - periodic downloaded static route

Gateway of last resort is not set

O IA 10.0.0.0/8 [110/129] via 30.0.0.1, 00:00:33, Serial3/0
O IA 20.0.0.0/8 [110/128] via 30.0.0.1, 00:00:43, Serial3/0
   30.0.0.0/8 is variably subnetted, 2 subnets, 2 masks
C     30.0.0.0/8 is directly connected, Serial3/0
C     30.0.0.1/32 is directly connected, Serial3/0
C     40.0.0.0/8 is directly connected, FastEthernet0/0
C     172.16.0.0/16 is directly connected, Loopback0
Router#
```

The image shows a Packet Tracer PC0 Command Prompt window. The window has a title bar with 'PC0' and standard minimize, maximize, and close buttons. Below the title bar are four tabs: 'Physical', 'Config', 'Desktop', and 'Custom Interface'. The 'Desktop' tab is active, and a 'Command Prompt' window is open. The Command Prompt window has a blue title bar with 'Command Prompt' and a close button. The text inside the Command Prompt window is as follows:

```
Packet Tracer PC Command Line 1.0
PC>ping 10.0.0.10

Pinging 10.0.0.10 with 32 bytes of data:

Reply from 10.0.0.10: bytes=32 time=4ms TTL=128
Reply from 10.0.0.10: bytes=32 time=7ms TTL=128
Reply from 10.0.0.10: bytes=32 time=7ms TTL=128
Reply from 10.0.0.10: bytes=32 time=8ms TTL=128

Ping statistics for 10.0.0.10:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 4ms, Maximum = 8ms, Average = 6ms

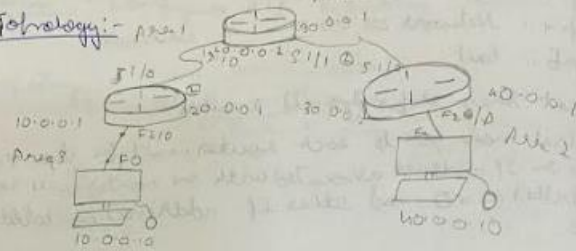

PC>
```

27/7/23

Week - 7

Aim :- configure OSPF routing protocol

Topology:-

Procedure:-

- create the topology using 3 routers & 2 PCs
- Configure the PCs with IP address and gateway
- Configure each of the routers acc. to IP address given.

→ Execute the following commands.

Router > CLI > config mode.

Step 1:- Router R1

Step 2:- router id 1.1.1.1

Step 3:- Network 10.0.0.0

Step 4: Network 20.0.0.0

Step 5: exit

→ Repeat these commands for other routers.

→ Then type show ip route

→ Next to set loopbacks

Step 1: (in config if mode) interface loopback 0

Step 2: ip address 17.2.16.1 255.255.255.0.0

Step 3: No shut down

→ Repeat these steps 3 for other 2 routers

→ Create virtual links b/w R1, R2 by this we create a virtual link ~~to R1~~ to connect to area 0.

→ In config mode of R1

step 1: router ospf 1

step 2: area 1 virtual-link 2.2.2.2

step 3: # enter/exit

In route 2 config - mode

step 1: # router ospf 1

step 2: area 1 virtual-link 1.1.1.1

step 3: exit

step 4: #

→ check the routing table, show ip route

→ Lastly ping messages from PC to PC

Ping output:-

→ Packet traces PC command line 10

PC > ping 40.0.0.10

Pinging 40.0.0.10 with 32 bytes of data:

Request timed out

Reply from 40.0.0.10: bytes=32 time=11ms TTL=125

Reply from 40.0.0.10: bytes=32 time=11ms TTL=125

Reply from 40.0.0.10: bytes=32 time=8ms TTL=125

⇒ Ping statistics for 40.0.0.10:

Packets: sent=4, received=3, lost=1 (25% loss)

Approximate round trip times in milliseconds

min=8ms max=11ms Avg=10ms

Observation:-

OSPF is a link-state routing protocol that is used to find the best path between source and destination route using its own SPF Algorithm.

⇒ This network is divided into 4 areas. core area is the backbone.

⇒ After we make the virtual-link between the area which is not connected to the backbone area, we can ping messages successfully.
